# Phototherapy Machines for Neonatal Jaundice

*We Love. We support./ We care.*

Neonatal jaundice, though common and treatable, can lead to permanent brain damage if treatment is delayed. Without timely phototherapy, babies risk developing kernicterus, which can cause cerebral palsy, hearing loss and developmental delays. These life-altering complications are entirely preventable.

During a hospital visit, we witnessed newborns taking turns to use limited phototherapy machines. While skilled medical teams work tirelessly, they urgently need more equipment to treat every baby promptly.

With proper treatment, babies recover quickly and thrive! Every new machine means more new-borns receive immediate care, preventing devastating outcomes. We have the unique opportunity to ensure no baby has to wait for this essential, life-saving treatment.

**58,000 GHC PER UNIT**

Number of machines needed: min 3
